

This review sheet is intended to cover everything that could be on the exam; however, it is possible that I will have accidentally left something off. You are still responsible for everything in the chapters covered except anything that I explicitly say you are not responsible for. Therefore, if I left something off of this sheet, it can still be on the exam. There will be no multiple-choice questions. Most of the questions will be like the ones in the homework assignments, and possibly a few definition questions, but I am more likely to ask questions that make you use the definitions rather than recite them. I will probably ask one of the questions from the book at the end of the chapters or in the study guide.

The review session will be Tuesday, 4/19, at 7:30, in the normal room (I hope).

Chapter 12, starting at page 281: Understand what the multiplier, a.k.a. the autonomous expenditure multiplier, a.k.a. the government spending multiplier, is and the process that causes it to be greater than 1. Do not worry about the specific formula because it will change when investment, taxes, and/or imports become functions of income. Know how to derive the AD curve from the 45° diagram, a.k.a. the Keynesian cross diagram. Why do price changes effect the multiplier?

Chapter 13: What is fiscal policy? What should the government do with taxes and spending if there is an inflationary gap or a recessionary gap? Show those actions on the LRAS/SRAS/AD diagram. What are the drawbacks of doing fiscal policy, for example, crowding out investment and lags? Why are these problems? What is the Laffer Curve and why does it matter? What is Ricardian Equivalence and why should it hold? Note that Ricardian Equivalence, the size of crowding out and lags are often debated among economists. What are automatic stabilizers? What determines the size of the government deficit/surplus? Why should we know the unemployment rate when considering the desirability or lack of desirability of the deficit? How does a deficit differ from the debt? Ignore the appendix, except that it can help you understand the chapter.

Chapter 14: Why should money be a good medium of exchange, unit of account, store of value, and standard of deferred payment? What is meant by liquidity? What backs our money? Know what is in M1, M2, but not M3. You only have to know the items in them that the book mentions. (There are other parts of M2 and M3 that the book leaves out.) Know the properties of each item in them. Know what happens when we move money between them. Hints: Do not forget that M1 is in M2. Unless you are taking a loan, then M2 doesn't change. What is financial intermediation? Do not worry about adverse selection and moral hazard. Do not worry about what each organization in Table 14-2 does. Ignore pages 333 - 336. What is the Federal Reserve? What does it do? What are its tools? How do they affect the money supply? (That is covered in more detail in chapters 15 and 16.) The map on page 338 incorrectly has us in the Richmond district. We are in the Cleveland district.

Chapter 15: What are reserves? How do we calculate required reserves? It's 10% of checkable deposits, a.k.a., demand deposits. What goes on each side of the balance sheet of a bank? What are open market operations and how do they affect the balance sheet of the bank? Ignore the balance sheet of the Fed. How does the money supply change? What is the reason the money can grow 10 times the original bond purchase? What is the formula for the money multiplier? Why is it too large? How does the discount rate affect the money multiplier? **Note that if I ask about "the multiplier" it is the autonomous expenditure multiplier I will be referring to. If I mean the money multiplier, then I will specify it.** What does the FDIC do? How does FDIC affect a bank's willingness to make risky loans?

This is the non-graded assignment #8A that will be gone over with assignment #8.

1) (15 points) Why is the money multiplier greater than one? In other words, how can the Fed's buying of a \$1000 bond ultimately lead to more than \$1000 increase in the money supply?

2) (15 points each) Illustrate the following events on the balance sheet for a bank. Briefly explain how you got the entries. How much does the money supply change in that step alone?

- A) The Fed buys a \$100 bond from the bank.
- B) The bank loans \$500 to a customer.
- C) The bank borrows \$50 from the Fed.

3) (20 points) When we calculated the money multiplier, we assumed that the money is redeposited in the bank. What would happen to the size of the money multiplier if that assumption was relaxed?

Explain your logic.

4) (20 points) Use the balance sheet to the right to answer this question. What number should replace the “?” in “other” on the balance sheet? How much are the bank’s excess reserves? How much would the money supply increase if they loaned out all they could and the money multiplier worked to its full extent? Briefly explain your answers.

Assets		Liabilities and Net Worth	
Cash	100	Demand deposits	2000
Deposits at Fed.	150	Savings accounts	1000
Loans	3000	Loans	0
Bonds	500	Other	?
Other	250	Equity	800

Review Sheet for the two parts of the final.

The optional review session for the first part of the final will be Tuesday 4/26, at 7:30 in the normal room. (I hope.) The “review session” for the second part will be in class on 12/8.

The two parts of the final will be in the same order as last year, which is the opposite order of the first two semesters. The second half of the final will be just like the second half of the final for the last semester. It will be the same except you will have different numbers. If I were you, I would use a Keynesian, but not extreme Keynesian, approach to solve the problem because it is easier to solve problems in a Keynesian world. (That does not mean that Keynes is right, just easier to deal with.) Chapter 17, up to page 405 will be helpful even though we will not cover it directly. For the second half of the final, you will probably want to practice showing policy on the SRAS/LRAS/AD diagram, 45° diagram, and the MS/MD diagram **at the same time**. Make sure that GDP goes the same direction in the two diagrams with it on the X-axis.

The first part of the final will be held the last day of class. It will cover the material that is not directly covered by the second half of the final. For example, I will not ask you to show an increase in the money supply on the LRAS/SRAS/AD diagram. Anything on any review sheet that is not explicitly covered in Part 2 of the final is fair game.

When I write the final, I look to see what I did not ask about, and what were the major topics. I write questions about those topics. (Obviously, opportunity costs and supply/demand will be on the first half of the final.) I try to get the questions evenly distributed from all the tests. However, the second half of the final covers much of the material for tests 3 and 4 with some of test 2. Therefore, most of the material for the first half of the final will be on material from tests 1 and 2, with some questions from the other material covered.

Chapter 16: What determines the demand for money? What are transaction, precautionary, and asset demand for money? Be able to move the MS and MD curves. Ignore the S/D for bonds. Illustrate the effects of monetary policy on LRAS/SRAS/AD diagram. Understand why $MV=PY$. Understand why monetarists do not like monetary policy. (This is the lags from chapter 13 again, but they are of different lengths than they were there.) Why can't the Fed choose to set both interest rates and the money supply?

Non-graded assignment based upon chapter 16.

- 1) (50 points) Illustrate an increase in the money supply on the LRAS/SRAS/AD diagram and on the MD/MS diagram. Explain why the curve(s) moved as drawn.
- 2) (25 points) Illustrate an increase in the GDP on the supply and demand for money. Explain why the curve(s) moved as drawn.
- 3) (25 points) Use the supply and demand for money to explain why no central bank can control both interest rates and the money supply. (Of interest, if the central bank wants to control the exchange rate, then it cannot control either the interest rates or the money supply.)
