This review sheet is intended to cover everything that could be on the exam; however, it is possible that I will have accidentally left something off. You are still responsible for everything in the chapters covered except anything that I explicitly say you are not responsible for. Therefore, if I left something off of this sheet, it can still be on the exam. There will be no multiple-choice questions. Most of the questions will be like the ones in the homework assignments, and possibly a few definition questions, but I am more likely to ask questions that make you use the definitions rather than recite them. I will probably ask one of the questions from the book at the end of the chapters.

The review session will be at a time to be determined in class, probably 4/24.

Chapter 11: What are the four assumptions of the **classical school**? What did **Say say**? How does it relate to the **SRAS curve**? Note that we went into more detail than the book on that explanation. How does it relate to labor supply and labor demand? Why should S = I? What assumptions did **Keynes** make? How did that relate to the SRAS curve? Why do we draw the "**Modern**" SRAS? *Unless I specify otherwise, when I refer to the SRAS, use the "Modern SRAS."* What moves the SRAS? *Notice that the only thing that moves SRAS without moving LRAS is the price of inputs because they do not affect how much could be produced if we are at full employment. Note the book has useful tables on pages 216 (Chapter 10) and 239, which is slightly misleading in the next to last line. Marginal **business and/or sales** tax rates move the SRAS because it is a cost of production, while marginal **income** tax rates affect aggregate demand because they reduce income, not raising the cost of production. The prices of inputs only temporarily affect the costs of production without any long-term effects. Since expected future price increases will increase wages, which are an input price, it will move only the AD and SRAS curves but not the LRAS curve.* What is meant by **supply shock** and **demand shock**? What are **inflationary and recessionary gaps**? How will they solve themselves if the government takes no actions? What are the demand pull and cost push inflations? How does a change in the value of the dollar on the foreign exchange market affect the SRAS/LRAS/AD diagram? *Note that the book should combine the panels in Figure 11-12. Unless specified otherwise, use the "modern" SRAS curve when asked for the SRAS curve. If you are not told that unemployment is high or low (recessionary gap or inflationary gap respectively), start your graph with LRAS crossing SRAS where it crosses AD.*

Chapter 12: Note we will not be making the Assumption #4 on Page 251. We will assume an open economy. What are C, I, G, and X? What determines them? Know what moves the flatter line on the **45° diagram, a.k.a. the Keynesian Cross diagram**. *We only need the C + I + G + X line and to move it. The other lines, like the C and the C + I lines were just to help you understand the main line. Ignore the savings line and the S = I derivation of the model. It is mathematically the same as what we did and the book does, but it is more complicated to understand.* What are the **MPC, MPS, APC,** and **APS**? *Note that even though our model assumes the MPC is the same for rich and poor, it also concludes that the rich will have a lower APC than the poor. It is easier to notice a person's APC than MPC.* Know what changes C, I, G, and X. Why does consumption depend upon wealth, although not much? Why does investment depend upon interest rates? Ignore the planned versus unplanned investment. What is a lump-sum tax and how does it affect the 45° diagram? What determines net exports? *Note that the AD line is virtually the same as the C + I + G + X line.* Both represent how much is being demanded. However, changes in the price level will move the C + I + G + X line but not AD line. What determines the size of the **government spending multiplier**? What is the economics behind it? How do we see it on the Keynesian Cross diagram?

Chapter 13: What is fiscal policy? What should the government do with taxes and spending if there is an **inflationary gap** or **a recessionary gap**? Show those actions on the **LRAS/SRAS/AD diagram**. What are the drawbacks of doing fiscal policy, for example, **crowding out investment, direct expenditure offset,** and **lags**? Why are these problems? What is the **Laffer Curve** and why does it matter? What is Ricardian Equivalence and why should it hold? Note that **Ricardian Equivalence**, the size of crowding out and lags are often debated among economists. What are automatic stabilizers? What determines the size of the **government deficit/surplus**? Why should we know the unemployment rate when considering the desirability or lack of desirability of the deficit? How does a deficit differ from the **debt**? Be able to calculate the **full-employment deficit**. Ignore the appendix, except that it can help you understand the chapter.

Chapter 14: What is the difference between the budget deficit and the government debt? What are the problems caused by them? To what extent are these arguments valid: **high interest payments hurt, future generations must pay the debt, crowding out,** and **we owe foreigners the money**? How is the government deficit related to the **trade deficit**, i.e., the **twin deficits**? Why is it important to know why the deficit is big? How are the short-run and long-run effects of the deficit different? Why is it difficult to reduce the deficit? For example, why are most expenditures tough to cut and why isn't raising taxes a good option? Why does **Paul O'Neill** say that the government owes a lot more than the amount they borrowed?

Chapter 15: Why should money be a good **medium of exchange, unit of account, store of value,** and **standard of deferred payment**? What is meant by **liquidity**? What backs our money? Know what is in **M1** and **M2**, but not M3. You only have to know the items in them that the book mentions. (There are other parts of M2 and M3 that the book leaves out.) Know the properties of each item in them. Know what happens when we move money between them. Hints: Do not forget that M1 is in

M2. Unless you are taking a loan, then M2 doesn't change. What is **financial intermediation**? What are **adverse selection** and **moral hazard** and why are they a problem? Do not worry about what each organization in Table 15-2 does. What is the **Federal Reserve**? What does it do? What are its tools? How do they affect the money supply? (That is covered in more detail in Chapter 16 after the test.) The map of the Federal Reserve Districts incorrectly has us in the Richmond District. We are in the Cleveland District. Do not worry about the balance sheets or the money multiplier. What is the **FDIC**? How does it result in moral hazard and adverse selection? Ignore the rest of the chapter.

This is the non-graded Assignment #9A that will be reviewed with Assignment #9.

1) (10 points each) For each event, determine what happens to M1 and M2. Explain your logic. Use a separate paragraph for each part.
A) You move $600 from a savings account to a checking account.
B) You buy a $300 book using a check.
C) You pay for $50 coat with a credit card.

2) (15 points) Money is supposed to be liquid. Does M1 or M2 do a better job of meeting that goal? Explain your logic.

3) (25 points) What is *adverse selection*? Give an example from the banking industry. Explain how banks reduce that problem.

4) (25 points) What is *moral hazard*? Give an example from the insurance industry. Explain how insurance companies reduce the problem.

Material after Exam #4

Chapter 16: What determines the demand for money? What are transaction, precautionary, and asset demand for money? Be able to move the **MS** and **MD** curves. Ignore the S/D for bonds. Illustrate the effects of **monetary policy** on LRAS/SRAS/AD diagram. Understand why **MV=PY**. Understand why **monetarists** do not like monetary policy. (This is the lags from Chapter 13 again, but they are of different lengths than they were there.) Why can't the Fed choose to set both interest rates and the money supply?

This is the non-graded Assignment #9B that will be reviewed before the final.

1) (40 points) Illustrate an increase in the money supply on the LRAS/SRAS/AD diagram and on the MD/MS diagram. Explain why the curve(s) moved as drawn.

2) (40 points) Illustrate an increase in government spending on the LRAS/SRAS/AD diagram and on the MD/MS diagram. Explain why the curve(s) moved as drawn.

3) (20 points) Use the supply and demand for money to explain why no central bank can control both interest rates and the money supply. (Of interest, if the central bank wants to control the exchange rate, then it cannot control either the interest rates or the money supply.)

Review Sheet for the two parts of the final.

The optional review session for the first part of the final will be determined by group decision. The "review session" for the second part will be in class on 5/2. The first half of the final will be the last class (5/9) and the second half is Tuesday, March 14th, 3:00 - 5:00.

The two parts of the final will be in the same order as the last few years, which is the opposite order of the first two semesters. **The second half of the final** will be just like the second half of the final for the last semester. (However, I may slightly change the manner which I assign points.) If I were you, I would use a Keynesian, but not extreme Keynesian, approach to solve the problem because it is easier to solve problems in a Keynesian world. (That does not mean that Keynes is right, just easier to deal with.) For the second half of the final, you will probably want to practice showing policy on the SRAS/LRAS/AD diagram, 45° diagram, and the MS/MD diagram **at the same time**. Make sure that GDP goes the same direction in the two diagrams with it on the X-axis. **The second half of the final** is open book and notebook.

The first part of the final will be held during the last class. It will cover the material that is not directly covered by the second half of the final. For example, I will not ask you to show an increase in the money supply on the LRAS/SRAS/AD diagram. Anything on any review sheet that is not explicitly covered in Part 2 of the Final is fair game.

When I write the final, I look to see what I did not ask about, and what were the major topics. I write questions about those topics. (Obviously, opportunity costs and supply/demand will be on the first half of the final.) I try to get the questions evenly distributed from all the tests. However, the second half of the final covers much of the material for Tests #3 and #4. Therefore, much of the material for the first half of the final will be on material from Tests #1 and #2, with some questions from each of the other tests' material.
