

This review sheet is intended to cover everything that could be on the exam; however, it is possible that I will have accidentally left something off. You are still responsible for everything in the chapters covered except anything that I explicitly say you are not responsible for. Therefore, if I left something off of this sheet, it can still be on the exam. There will be no multiple-choice questions. Most of the questions will be like the ones in the homework assignments, and possibly a few definition questions, but I am more likely to ask questions that make you use the definitions rather than recite them. I will probably ask one of the questions from the book at the end of the chapters.

The review session will be determined in class, but probably Thursday, 1/31, in the computer lab.

Chapter I: What is **forecasting**? Who does forecasting? What is the test of a good forecast?

Chapter II: What are **leading, lagging, and coincident indicators**? Understand the economic reason that the variables listed on Page 22 are listed in the categories under which they appear. Why must the variable have **economic significance, statistical adequacy, timing, conformity, smoothness, and currency** to be a good indicator?

Chapter III: Why does the analysis require calculating moving averages? What is **the MCD (Months of Cyclical Dominance)** and why is this important? If I gave you Table 3 from Page 38, or Table 4 on Page 40, then you should be able to tell me what the numbers represent and which variables are stronger indicators. Be careful to use the correct column for expansion or contraction. Be able to interpret what is occurring if some variables are expanding and others are not.

Chapters IV and V: These are just definitions. Learn them.

Chapter 8: What do the following terms mean: **aggregate economic activity, expansions, boom, contraction, recession, depression, peak, trough, business cycle, co-movement, recurrent but not periodic, and persistent**? Why have business cycles become longer and less severe since World War II? What determines if a variable is **pro-cyclical, counter-cyclical, or acyclical**? What are **lagging, leading, and coincident variables**? If I gave you a variable, you should be able to determine which type of variable it is and the economic reason for that. If a variable is a good indicator, then why should a variable have consistent timing and send a strong signal with few false signals? Understand why the **SRAS/LRAS/AD diagram** takes its shape and what moves them.

This is the non-graded Assignment #2A that will be reviewed with Assignment #2.

- 1) (25 points) Draw the SRAS/LRAS/AD diagram with an unemployment rate of 7%. Explain how you know the unemployment rate is 7%. Illustrate how the economy would get back to equilibrium if there was no government intervention. Explain why the curve(s) moved as drawn. What happens to the GDP, price level, and unemployment rate?
- 2) (20 points) Draw the SRAS/LRAS/AD diagram. Illustrate the effects of an increase in government spending. Explain why the curve(s) moved as drawn. What happens to the GDP, price level, and unemployment rate?
- 3) (20 points) Draw the SRAS/LRAS/AD diagram. Illustrate the effects of a decrease in the price of oil. Explain why the curve(s) moved as drawn. What happens to the GDP, price level, and unemployment rate?
- 4) (10 points each) For each of the following, determine if it is normally procyclical or counter-cyclical. Explain your logic.
 - A) Average productivity of labor
 - B) Inflation
 - C) Real wage rate
- 5) (5 points) Why is it likely that business cycles have become less severe?
